STUDENTS WORKING COLLABORATIVELY
How can we foster scientific discussion?

Introduction

If students are to make sense of scientific and mathematical concepts, then they will need opportunities to share, discuss and work together. Research has shown that cooperative small group work has positive effects on learning, but that this is dependent on the existence of shared goals for the group and individual accountability for the attainment of these goals. It has also been seen to have a positive effect on social skills and self-esteem (Askew & Willam, 1995).

In many classrooms, however, traditional transmission teaching styles have reduced both the quantity and quality of student-student discussion. In others, students do work and talk together, but this talk does not always profit learning.

This unit is designed to offer the professional development provider some resources that will help teachers to:

• consider the characteristics of student-student discussion that benefit learning;
• recognise and face their own worries about introducing collaborative discussion;
• explore techniques for promoting effective student-student discussion;
• consider their own role in managing student-student discussion;
• plan discussion based lessons.

The activities described below are given here as a 'menu' of suggestions to help the provider plan. They are presented in a logical order, building up knowledge and expertise. Any planned professional development program should offer opportunities for teachers to take risks and try new pedagogies in the classroom and then report back and reflect on their experiences. Activity G is therefore essential in the program and should not be missed!

Activities

Activity A: Experiencing a discussion .................................................................2
Activity B: Analysing a discussion .................................................................4

ACTIVITY A: EXPERIENCING A DISCUSSION

Time needed: 20 minutes.

Teachers find it helpful, and enjoyable, to engage in a collaborative activity themselves before discussing classroom issues. This activity will give a taste of this experience. It also offers an opportunity to reflect on the pedagogical implications for the classroom.

We suggest that you choose just one of the problems shown on Handout 1 for this activity, or substitute a similar problem of your own.

- On your own, write down a response to one of the problems on Handout 1.
- Together with your colleagues, compare your responses and try to refine your answers until you feel that you have reached a consensus.
- Take a few moments to reflect on the experience you have just had.
  - Did you find it helpful to have a chance to think about the question yourself before it was discussed in your group?
  - How far did you really think together, or did you tend to follow independent lines of thought?
  - Did someone ‘take over’? Was someone a ‘passenger’?
  - Did you listen to, share ideas with and consider the alternative views of everyone in the group?
  - Did you build on each others’ ideas to construct chains of coherent reasoning?
  - Did you feel able to share your ideas without fear of embarrassment of being wrong? Did anyone feel uncomfortable or threatened? If so, why?
  - Did your discussion stay ‘on task’ or were you ‘wandering’?
- What are the implications of this activity for your classroom?

Teachers may not complete the problem in the time you have allowed, but do not worry too much about this. What is important is that they have had time to discuss and explore their ideas about one problem together. They may also want to know ‘the answer’. It is interesting to ask different groups to compare answers, but resist giving them a ‘definitive’ answer - in fact most of the problems do not have one definitive answer. That is what makes them good discussion questions!

The initial time for individual work is important. When students are put straight into groups before they have had time to think for themselves, the ‘quick thinking’, confident students are more likely to take over and dominate the group. When students prepare something to share, and then take it in turns to make a contribution, more thoughtful and engaging discussions will result.

The questions asked here reflect the characteristics of powerful discussions that emerge from research literature (Alexander, 2006, 2008; Mercer, 1995, 2000). This is discussed more explicitly in the next activity.
# Handout 1  Experiencing a discussion

## Golf shot
How does the speed of the golf ball change as it flies through the air in this amazing golf shot?

Sketch a speed v time graph to illustrate your answer.

## Teachers
About how many teachers are there in your country?

Try to make a reasonable estimate based on facts that you already know.

## Which Sport?
Which sport could this graph represent?

## Particles
Which of the following arguments provides the best evidence that matter is made from particles?
- Air in a syringe can be squeezed
- The crystals of a pure substance have the same shape
- Water in a puddle disappears
- Paper can be torn into small pieces

---

ACTIVITY B: ANALYSING A DISCUSSION

Time needed: 15 minutes.

There is a clear difference between working in a group and working as a group. It is quite common to see students working independently, even when they are sitting together. Disputational talk, in which students simply disagree and go on to make individual decisions is not beneficial. Neither is cumulative talk in which students build uncritically on what each other has said. For true collaborative work, students need to develop exploratory talk consisting of critical and constructive exchanges, where challenges are justified and alternative ideas are offered (Mercer, 1995, 2000). It is not enough for students to simply give each other right answers, as this does not produce enhanced understanding (Reynolds and Muijs, 2001). The most helpful talk appears to be that where the participants work on and elaborate each other’s reasoning in a collaborative, rather than competitive atmosphere. Exploratory talk enables reasoning to become audible and ‘publicly’ accountable.

In this activity, the teachers are given transcripts from classroom discussions and are invited to discuss how the discussions either help or hinder learning. Instead of transcripts, you may prefer to show some video clips of student-student discussions for this activity.

- Role-play each of the two transcripts on Handout 2.
- Look at the characteristics of helpful and unhelpful talk shown on Handout 3.
- Which of the characteristics in Handout 3 do you recognise in these transcripts?
- Would you describe the discussions as Disputational, Cumulative or Exploratory?
- What strategies could you use that would help students to discuss more profitably?

The Find the elephant transcript is disputational. The two boys are treating the computer software as a competitive game, making random guesses. They laughed or made derisory comments when their partner made an incorrect guess. There is little evidence of collaborative thinking.

The Rail prices transcript is more exploratory. These students are clearly listening to and engaging with each others’ reasoning. Dan and Harriet are both working together to convince Andy and are backing up their argument with an example.

The Always, sometimes, or never true transcript is more cumulative. The students are trying to get through the task as quickly as possible. They do not disagree or challenge each other, they simply reinforce each others’ unqualified assertions.

Clearly, the only dialogue that shows evidence of learning here is the one on Rail prices. The final question challenges teachers to think of ways of encouraging this kind of talk. One possible suggestion is that students themselves may role play different ways of working together and discuss how learning takes place.
2 Analysing a discussion

Find the elephant

Lester: I can do it.

Seans: Soft turning of the screen No, not up, down.

Lester: It can’t be.

Seans: It can.

Lester: I know where it is. (Seans eventually takes his turn, but fails to find the elephant.)

Lester: I told you it wasn’t here. (He then takes his turn, without success.)

Seans: Oh, he’s hiding. (Laughter greets this)

Lester: Which one just went off? I don’t know (looks somewhat worried/surprised).

Seans: 1, 2, 3, 4, 5, 6, 7, 8.

Lester: It has got to be 7.

Seans: (G. R.)

Seans: Oh, shut yourself.

Rail prices

Your students are discussing the following problem:

In January, times went up by 20%.

In August, they went down by 20%.

What did they do in total?

The answer is not 0%.

Narriti: That’s wrong, because they went up by 20%.

Jase: (Says it out loud)

Lester: I can’t remember.

Seans: 1, 2, 3, 4, 5, 6, 7, 8.

Lester: So has got to be 1, 8.

Seans: (G. R.)

Lester: I know where it is.

Seans: Get the answer.

Lester: 20% + 20% = 40%.

Seans: That’s it.

Narriti: 40%.

Seans: It’s true.

Lester: That’s true. Because if you add 20% to 40% it’s 60%.

Jase: We do 60%.

Seans: Dan’s given that.

Narriti: 60%.

Jase: We’ve got no clue.

Seans, Lester: We know it.

Jase: We’ve got no clue.

Seans: We know it.

Lester: We know it.

Narriti: We know it.

2 Analysing a discussion (continued)

Always sometimes or never true?

Two students are trying to sort some cards containing algebraic statements into categories: always true, sometimes true, never true (these are identities), sometimes true (in which case they should solve the equation to find the values of the variable that make the statement true) or never true (these should be inequalities).

The statements are:

Jase: Question 3 is sometimes true.

Sam: What is 3 + 3 + 3 + 3 + 3 + 3? Sometimes true.

Jase: That’s what just done.

Sam: 21 + 3 = 21. That’s more like that previous question. I’ve never seen anything like this before.

Jase: Sometimes true.

Sam: It might be. That one is an add.

Jase: Take away, take away. Let’s leave that one and go into the next one.

Sam: 3 × 3 = 9.

Jase: That’s true.

Sam: That’s true. Because if you add 2 you get 5. It’s true.

Sam: 3 + 2 = 5. That’s not true.

Jase: Never true.

Sam: Never heard of that before.

Sam: 4p is greater than 4.

Jase: Oh? We don’t know what p is through? It’s greater than 4 though isn’t it.

Jase: 4p = 9p.

Jase: I’ve got no clue for that one.

Jase: 4p = 9p.

Jase: We know it.

Jase: We know it.

Jase: We know it.

3 Characteristics of helpful and unhelpful talk

What types of talk engages students, develops understanding and promotes deeper thinking? Robin Alexander (2006) identified the following five principles of helpful classroom talk - which he terms dialogic.

Dialogic talk is:

- **Collective**: teachers and children address learning tasks together, as a group or as a class, rather than in isolation

- **Reciprocal**: teachers and children listen to each other, share ideas and consider alternative viewpoints

- **Cumulative**: teachers and children build on their own and each others’ ideas and chain them into coherent lines of thinking and enquiry

- **Supportive**: children articulate their ideas freely, without fear of embarrassment over ‘wrong’ answers and they help each other to reach common understandings

- **Purposeful**: teachers plan and facilitate dialogic teaching with particular educational goals in view

Neil Mercer (1995, 2000) identifies the following three types of student-student talk. It is the third type, exploratory talk, that is most helpful for learning:

**Cumulative talk**

Speakers build positively, but uncritically on what each other has said. This is typically characterised by repetitions, confirmations and elaborations.

**Disputational talk**

This consists of disagreement and individualised decision making. It is characterised by short exchanges consisting of assertions and counter-assertions.

**Exploratory talk**

Speakers work on and elaborate each other’s reasoning in a collaborative, rather than competitive atmosphere. Exploratory talk enables reasoning to become audible and knowledge becomes publicly accountable. It is characterised by critical and constructive exchanges. Challenges are justified and alternative ideas are offered.

---

ACTIVITY C: RECOGNISING THE CONCERNS OF TEACHERS

Time needed: 10 minutes.

This activity is designed to help teachers recognise and articulate their own concerns relating to collaborative work. It is important to address these explicitly, as they are often serious obstacles to them.

Handout 4 contains a number of concerns and opinions that are commonly expressed by teachers.

- Which of these do you share?
- In pairs, choose one of these comments and imagine that it was expressed by a teacher from your school. Take a few minutes to prepare a response. In the whole group, share your choice together with your response.

It is important to recognize that group work may not always be appropriate. When the purpose of the lesson is to develop fluency in a particular skill, then individual practice may be more suitable. This should not constitute the whole diet, however. Collaborative group work is necessary when the purpose of the session is to develop conceptual understanding or strategies for solving more challenging problems. In these cases, students need to share alternative views, interpretations or approaches.
## Common obstacles to classroom discussion

<table>
<thead>
<tr>
<th>Obstacle</th>
<th>Obstacles</th>

</thead>
<tbody>
<tr>
<td>Time pressures</td>
<td>“It’s a gallop to the main exam, we don’t have time for discussion”“Students will waste time in social talk. They would rather talk about what is on TV than about science or maths.”</td>
</tr>
<tr>
<td>Control</td>
<td>“What will other teachers think of the noise?”“How can I possibly monitor what is going on?”</td>
</tr>
<tr>
<td>Personal insecurity</td>
<td>“What if they start asking questions I cannot answer?”“What if they stray off the point of the lesson?”</td>
</tr>
<tr>
<td>Views of students</td>
<td>“My students cannot discuss.”“My students are too afraid of being seen to be wrong.”</td>
</tr>
<tr>
<td>Views of the subject</td>
<td>“In Mathematics, answers are either right or wrong – there is nothing to discuss.” “In Science if they understand it there is nothing to discuss, and if they don’t, they are in no position to discuss anything. In fact they may even spread their own misconceptions.”</td>
</tr>
<tr>
<td>Views of learning</td>
<td>“Mathematics/Science is a subject where you listen and practise.”“Learning is a private activity.”</td>
</tr>
</tbody>
</table>
ACTIVITY D: CREATING & ESTABLISHING "GROUND RULES" WITH STUDENTS

Time needed: 15 minutes.

As we have seen, students (and adults!) do not always discuss in helpful ways. Some are reluctant to talk at all, while others take over and dominate. Students therefore need to be taught how to discuss. Some teachers have found it helpful to introduce a list of ‘ground rules for discussion’ into their classes. These ground rules should, in appropriate language, give explicit guidance to students on how to talk together profitably.

- Imagine that you are starting with a new class. You want them to begin to work collaboratively. What classroom "rules" would you seek to establish?
- The ground rules on Handout 5 was developed for use with one class of students. Compare your ideas with those offered here.
- How would you encourage your students to follow these rules?
- How could you involve your students in developing such a list?
5  **Ground rules for students**

Here are some suggested ‘ground rules’ for **students** to use as they work in groups. These could be displayed and reinforced over time. Maybe you could involve your class in drawing up a similar list.

<tr>
<td>10. <strong>Reach agreement</strong></td>
<td>&quot;We've got the general idea, but we need to agree on how we will present it.&quot;</td>
</tr>
</tbody>
</table>
ACTIVITY E: MANAGING COLLABORATIVE DISCUSSION

Time needed: 15 minutes.

A well-organised discussion lesson often has a number of distinct phases:

- **Individual 'thinking time'**.
  Students think about the problem before the discussion begins. Without this opportunity, the discussion is likely to be dominated by more confident and assertive students.

- **Small group discussion**.
  Students share and refine their ideas in small groups.

- **Whole class discussion**.
  Students 'report back' to the class, and share their ideas with a wider audience.

In this session, participants consider these phases and in particular the teacher's role in each one.

How would you manage a discussion lesson?

- What is the purpose of 'thinking time'? What is your role?
- What is the purpose of the small group discussion? What is your role?
- What is the purpose of the final whole class discussion? What is your role?

Compare your thoughts with those given on Handouts 6 and 7.

Many teachers, used to transmission methods, appear unsure of their role during discussion lessons. When students are struggling, some quickly intervene and try to "ease the path" by giving strong hints and explanations. Others withdraw and offer little help, as though they now expect students to discover everything by themselves. The most effective teachers take neither of these positions. They challenge students to think more deeply, explain and justify (Handout 6):

- Make the purpose of the task clear
- Keep reinforcing the ‘ground rules’
- Listen before intervening
- Join in, don’t judge
- Ask students to describe, explain and interpret
- Make students do the thinking
- Don’t be afraid of leaving discussions unresolved.

Later in the lesson, when students have had an opportunity to think and discuss for themselves, a whole class discussion may be held in order to:

- present and report students' discussions;
- recognise and value the important ideas that have emerged;
- generalise and link these ideas to other situations.

During this phase of the lesson, the teacher’s role is to chair the discussion and help students to clarify their own thinking.
6 The teacher’s role during small group discussion

Make the purpose of the task clear
Explain what the task is and how they should work on it. Also, explain why they should work in this way. ‘Don’t rush, take your time. The answers are not the focus here. It’s the reasons for those answers that are important. You don’t have to finish, but you do have to be able to explain something to the rest of the class.’

Keep reinforcing the ‘ground rules’
Try to ensure that students remember the ground rules that were discussed at the beginning. Encourage students to develop a responsibility for each other’s understanding. ‘I will pick one of you to explain this to the whole class later – so make sure all of you understand it’.

Listen before intervening
When approaching a group, stand back and listen to the discussion before intervening. It is all too easy to interrupt a group with a predetermined agenda, diverting their attention from the ideas they are discussing. This is not only annoying and disruptive (for the group), it also prevents students from concentrating.

Join in, don’t judge
Try to join in as an equal member of the group rather than as an authority figure. When teachers adopt authoritative roles, students tend to try to ‘guess what’s in the teacher’s head’ rather than try to think for themselves. ‘Do you want us to say what we think, or what we think you want us to say?’

Ask students to describe, explain and interpret
The purpose of an intervention is to increase the depth of reflective thought. Challenge students to describe what they are doing (quite easy), to interpret something (‘can you say what that means?’) or to explain something (‘can you show us why you say that?’).

Make students do the thinking
Many students are experts at making their teachers do the work! They know that if they ‘play dumb’ long enough, then the teacher will eventually take over. Try not to fall for this. If a student says that he or she cannot explain something, ask another student in the group to explain, or ask the student to choose some part of the problem that she can explain. Don’t let them off the hook! When a student asks the teacher a question, don’t answer it (at least straight away). Ask someone else in the group to do so.

Don’t be afraid of leaving discussions unresolved.
Some teachers like to resolve discussions before they leave the group. When the teacher leads the group to the answer, then leaves, the discussion has ended. Students are left with nothing to think about, or they go on to a different problem. It is often better to reawaken interest with a further interesting question that builds on the discussion and then leave the group to discuss it alone. Return some minutes later to find out what has been decided.
ACTIVITY F: OBSERVE AND ANALYSE A DISCUSSION LESSON

Time needed: 20 minutes.

An 11 minute video clip is provided. This shows one class of secondary students engaging in a discussion lesson. Teachers may enjoy watching the lesson and discussing many of the issues raised in this professional development unit.

The video clip shows one teacher, Eve, teaching a class using the problem:

Estimate how many teachers there are in the UK.

The UK has a population of 60 million people.

Watch the video clip, and then consider the following issues:

- How does the teacher introduce the problem?
- Which 'ground rules' does she emphasise?
- What different approaches are being used by students?
- How does the teacher help students to discuss productively?
- Can you characterise the types of talk they are using? (Refer again to Handout 3)
The video clip shows the three phases of the lesson described in Activity E.
Handout 3. Characteristics of helpful and unhelpful talk

3 Characteristics of helpful and unhelpful talk

What types of talk engages students, develops understanding and promotes deeper thinking? Robin Alexander (2006)\(^1\) identified the following five principles of helpful classroom talk - which he terms dialogic.

Dialogic talk is:

- **Collective**: teachers and children address learning tasks together, as a group or as a class, rather than in isolation
- **Reciprocal**: teachers and children listen to each other, share ideas and consider alternative viewpoints
- **Cumulative**: teachers and children build on their own and each others' ideas and chain them into coherent lines of thinking and enquiry
- **Supportive**: children articulate their ideas freely, without fear of embarrassment over 'wrong' answers and they help each other to reach common understandings
- **Purposeful**: teachers plan and facilitate dialogic teaching with particular educational goals in view

Neil Mercer (1995, 2000)\(^2\) identifies the following three types of student-student talk. It is the third type, exploratory talk, that is most helpful for learning:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cumulative talk</td>
<td>Speakers build positively, but uncritically on what each other has said. This is typically characterised by repetitions, confirmations and elaborations.</td>
</tr>
<tr>
<td>Disputational talk</td>
<td>This consists of disagreement and individualised decision making. It is characterised by short exchanges consisting of assertions and counter-assertions.</td>
</tr>
<tr>
<td>Exploratory talk</td>
<td>Speakers work on and elaborate each other’s reasoning in a collaborative, rather than competitive atmosphere. Exploratory talk enables reasoning to become audible and knowledge becomes publicly accountable. It is characterised by critical and constructive exchanges. Challenges are justified and alternative ideas are offered.</td>
</tr>
</tbody>
</table>

---

ACTIVITY G: PLAN A LESSON, TEACH IT AND REFLECT ON THE OUTCOMES

Time needed:

- 15 minutes discussion before the lesson
- 1 hour for the lesson
- 15 minutes after the lesson

Plan a discussion lesson for your students. As you do this, discuss the following issues:

- Which task will you use? It should have scope for discussion.
- How will you arrange the room?
- How will you group students?
- How will you introduce the purpose of discussion?
- How will you establish ground rules?

Some notes on these issues are given on Handout 9.

- How will you organise the phases of the session?
  When will students be working individually?
  When will they be in small groups?
  When will there be a whole class discussion?

Refer back to Handouts 6 and 7 to support your planning.

Encourage teachers to record and transcribe some student-student discussions, if possible. After teachers have taught the lesson, meet again and discuss the following questions.

Compare the different lessons that have been experienced. How did you:

- Organise the room and introduce the task?
- Orchestrate and sustain phases of the work? (E.g. "Think, pair, share")
- Organise and share ideas as a whole class?

Give examples of helpful and unhelpful discussions that were evident. Play any recorded extracts of student-student talk from your lesson and discuss the type of talk this illustrates.

- Did students listen to and build on each others’ reasoning?
- Can you think of occasions when your own intervention was helpful? When was it unhelpful?
# Planning a lesson

| Plan to offer the task in a form that will encourage collaboration | Prepare shared tasks in a *form* that will encourage discussion. For example:
| | • Provide resources to share (e.g. one copy between three) and ask for outputs that are jointly produced.
| | • Provide *big* resources so that reasoning may be visible and shared, such as large sheets of paper, felt-tipped pens or ‘mini-whiteboards’.
| | • Require *joint outcomes*: e.g. a poster or a report. Make students share responsibility for this.
| Plan how you will arrange the room | Arrange tables and chairs so that students are facing each other while working together.
| | When computers are used, then pair two students to a computer and give them space and resources to record their joint thinking (e.g. using mini-whiteboards). Encourage turn taking when using the computer.
| Plan how you will group students | Most students are more able to discuss in smaller groups than larger ones: pairs or threes is often most effective.
| | Some teachers find a *snowball* approach helpful:
| | • Students first tackle the task individually. They have time to think before they are asked to discuss.
| | • Pairs are then formed and students are asked to try and reach agreement.
| | • Pairs then join together so that a broader consensus might be reached.
| | • Groups of four then report back to the whole class in a plenary discussion.
| Plan how you will introduce the purpose of discussing | Plan your introduction to pre-empt the questions:
| | • "Why do you want us to discuss?"
| | • "What do you want us to discuss?"
| | For example: *This lesson is not about ‘me showing you a method and then you using it’. No, I want to see if you can find your own methods. There is more than one way of doing this! I want you to discuss your own ideas for starting on this problem.*
| Plan how you will establish ground rules | Introduce ground rules for students. New habits are not established overnight, but over a long time through consistent reinforcement. |
